# A COMPARATIVE STUDY OF MOLECULAR LIPOPHILICITY INDICES OF SOME FORMYLAND ACETYLPYRIDINE-3THIOSEMICARBAZONE DERIVATIVES ESTIMATED BY RP- HPTLC AND CALCULATED LOG P VALUES 

## Cristina Onişor and Costel Sârbu

Babeş-Bolyai University, Faculty of Chemistry and Chemical Engineering, Cluj-Napoca, Romania costelsrb@yahoo.co.uk

## QSAR/QSPR/QSRR

> QSAR - Quantitative Structure-Activity Relations

- relates molecular structure to biological activity
> QSPR - Quantitative Structure-Property Relations
- correlates molecular information with different properties
> QSRR - Quantitative Structure-Retention Relations
- explains chromatographic retention by molecular information

## Lipophilicity

> Log P estimated by direct equilibration method or by calculation according to different mathematical models
> Octanol - water partition coefficient (Log P)

$$
P=C_{o} / C_{w}
$$

> The "flask shaking" method has some disadvantages:
> it is tedious
$>$ time consuming
$>$ may be applied in a limited range on the lipophilicity scale

## Estimation of Lipophilicity by RPTLC

> RPTLC method based on the assumed linear relationship between the molecular parameter $R_{M}$ and $\log P$

$$
R_{M}=\log (1 / R f-1)
$$

> $\boldsymbol{R}_{M}$ (related to molecular lipophilicity) depends linearly on the concentration of the organic modifier of the mobile phase

$$
R_{M}=R_{M o}+b C
$$

$>\varphi_{0}=R_{\mathrm{Mo}^{\prime}} / b$

## Principal Component Analysis

- Principal component analysis (PCA) is a favorite tool in chemometrics for data compression and information extraction.
- PCA finds linear combinations of the original measurement variables that describe the significant variations in the data.
- PCA represents in an economic way the location of the compounds in a reduced coordinate system describing the data set with maximum possible information.
- PCA gives both coordinates (scores) of the studied compounds and the loadings of variables on the principal components.

## Structure of the studied compounds

## Structure of the studied compounds

10

12

## Experimental

- Stationary phase: $\mathrm{C}_{18}$ silica gel bonded plates
, $\mathrm{RP}-\mathrm{C}_{18} / \mathrm{UV}_{254}(20 \times 20 \mathrm{~cm})$
. $\mathrm{RP}-\mathrm{C}_{18} \mathrm{~W}^{\mathrm{W}} \mathrm{UV}_{254}(10 \times 20 \mathrm{~cm})$ Merck (Darmstadt, Germany)
> Mobile phase: methanol-water (25-45 \%; 15-35 v/v)
> Colored zones appeared on a colorless background
> fluorescent blue-orange zones under UV lamp ( $\lambda=365 \mathrm{~nm}$ )

## Lipophilicity indices based on retention data ( $\mathrm{RP}-\mathrm{C}_{18}$ silica gel)

## Conclusions

> The lipophilic character of of formyl- and acetylpyridine-3thiosemicarbazone derivatives has been investigated using TLC retention data and and various calculated $\log P$
> Statistically significant correlations were found between lipophilicity indices, $\mathrm{R}_{\mathrm{M} \circ}, \varphi 0$, scores corresponding to $\mathrm{PC1}$ and a new scale based on the mean of retention indices
> The scores corresponding to PC1 and the mean of retention indices appeared to be the best solution for the lipophilicity scale resulted from the retention data
> LogP ${ }^{2}$, AvLogP and XLOGP have been appearing to be the most appropriate for chromatography

## Thank you for your attention!
