

Bioassays as a detection tool for thin layer chromatography

Irena Choma

UMCS Lublin Poland

HPTLC Basel 2011

Bioassays (biological activity tests) are screening or semi-quantitative methods, which are based on a measurement of an effect emerging in a given biological system as a result of biological action of the substances under investigation. Bio-detection enables searching for biologically active substances in complicated mixtures, what can be described as effect-directed analysis (EDA).

Biological activity tests are often hyphenated with separation methods, mostly with thin layer chromatography. The method is ideal for bioassays due to an open layer, which enables evaporation of solvents used as mobile phase components. The additional advantage of TLC is possibility of analyzing many samples in the same run.

Spectroscopic methods connected directly with TLC-bioassays can be used as confirmation methods giving full information about analytes.

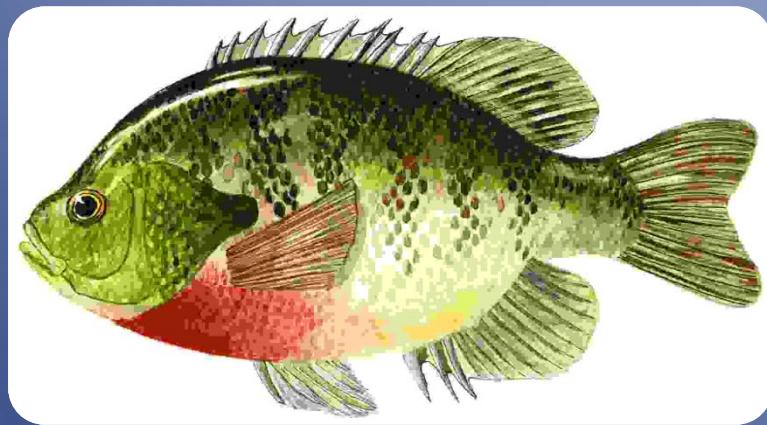

algae

daphnia

fish

plants

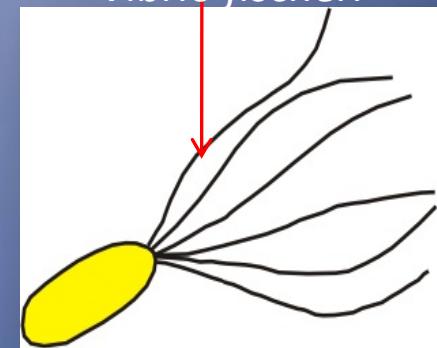

Cladosporium cucumerinum

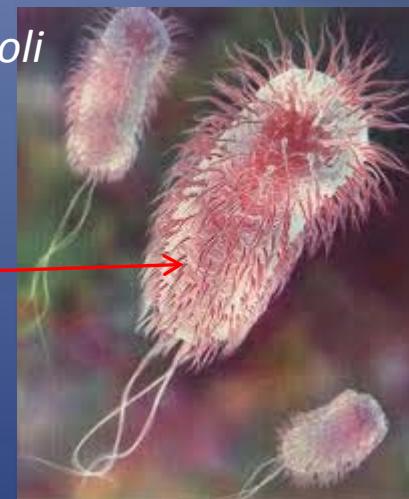

Candida albicans

Vibrio fischeri

Escherichia coli

Frequently used tests

1. Mutagenicity and genotoxicity tests (Ames test, COMET, SOS - Chromotest, Umu-test, Mutatox).
2. Estrogenic activity (Yes test).
3. Enzymatic tests (acetylcholinesterase inhibition test).
4. Aryl Ah receptor binding (CALUX, EROD)
5. Antioxidant and radical scavenging activity tests (DPPH, ABTS)
6. Microbial tests: dilution, diffusion and bioautographic.

Disc test *E. coli* (ATCC 25922)

Flumequine - 0,05 µg per disc

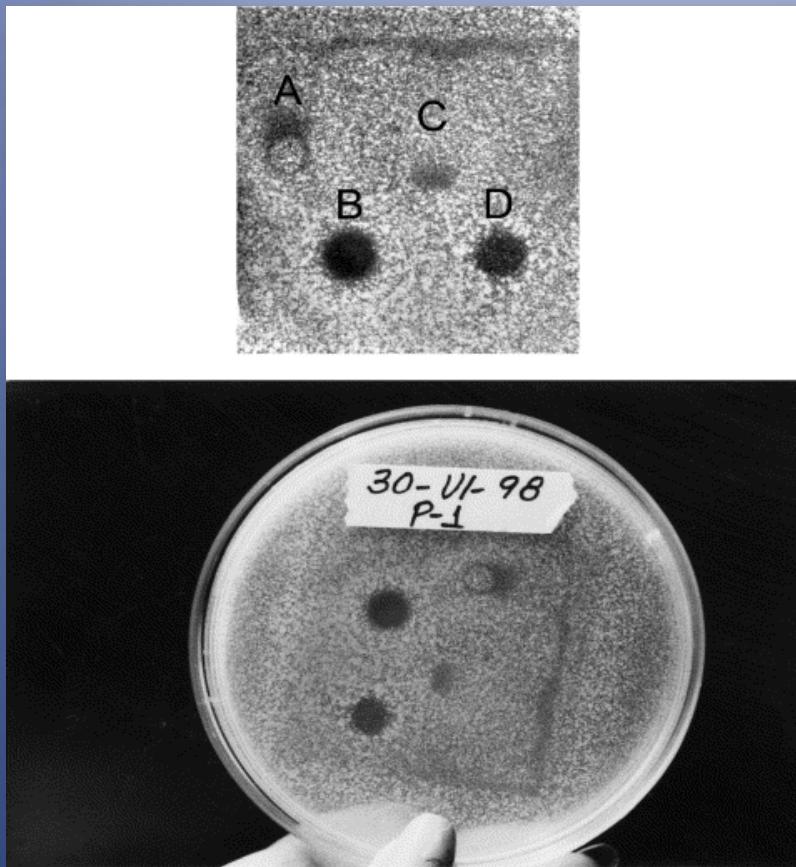

Flumequine - 5,0 µg per disc

Bioautography :

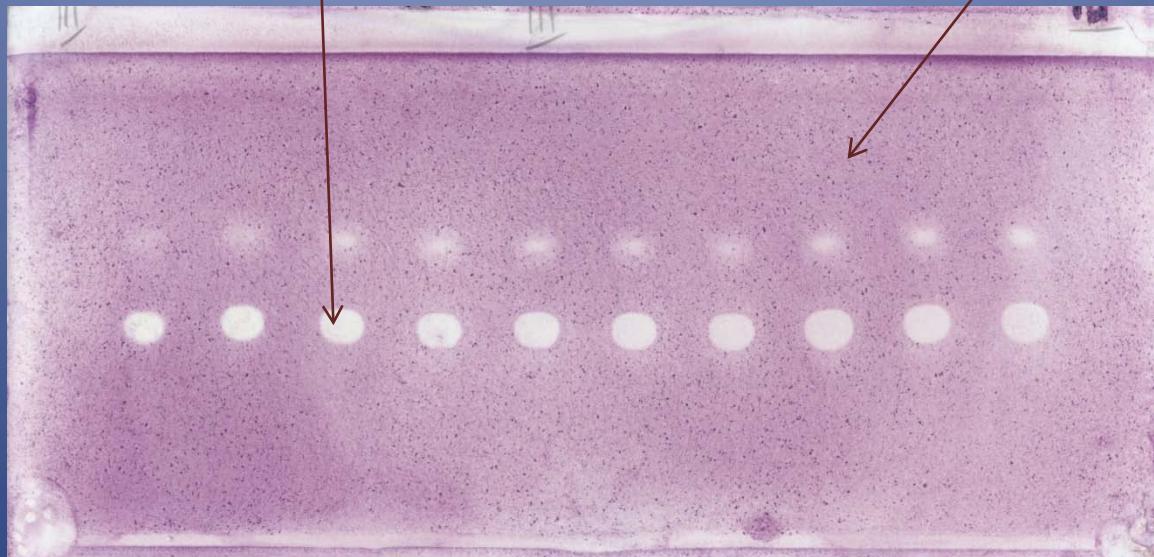

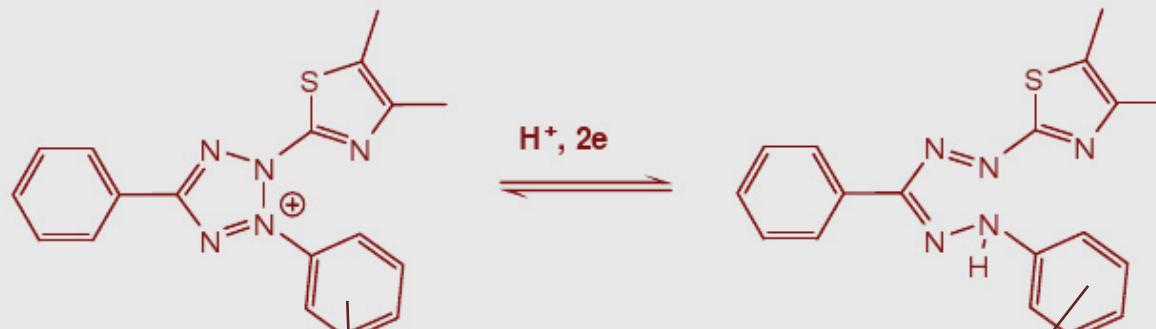

- Contact bioautography (agar diffusion),
- Immersion bioautography (agar-overlay),
- Direct bioautography – TLC-DB.

Contact bioautography

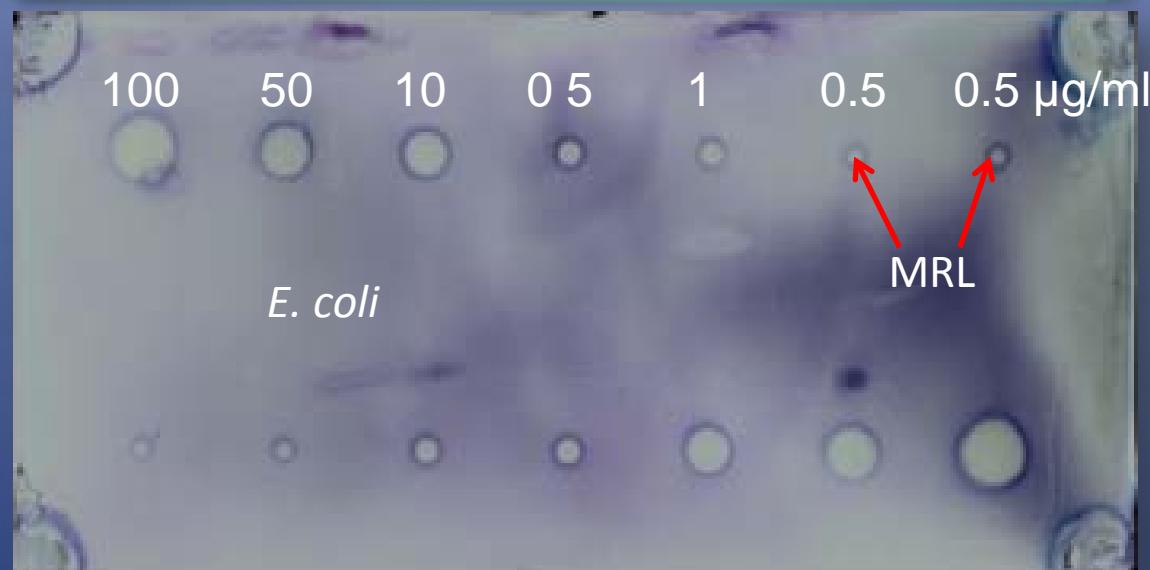

Direct bioautography

MTT

E.coli, cipro- and enrofloxacin

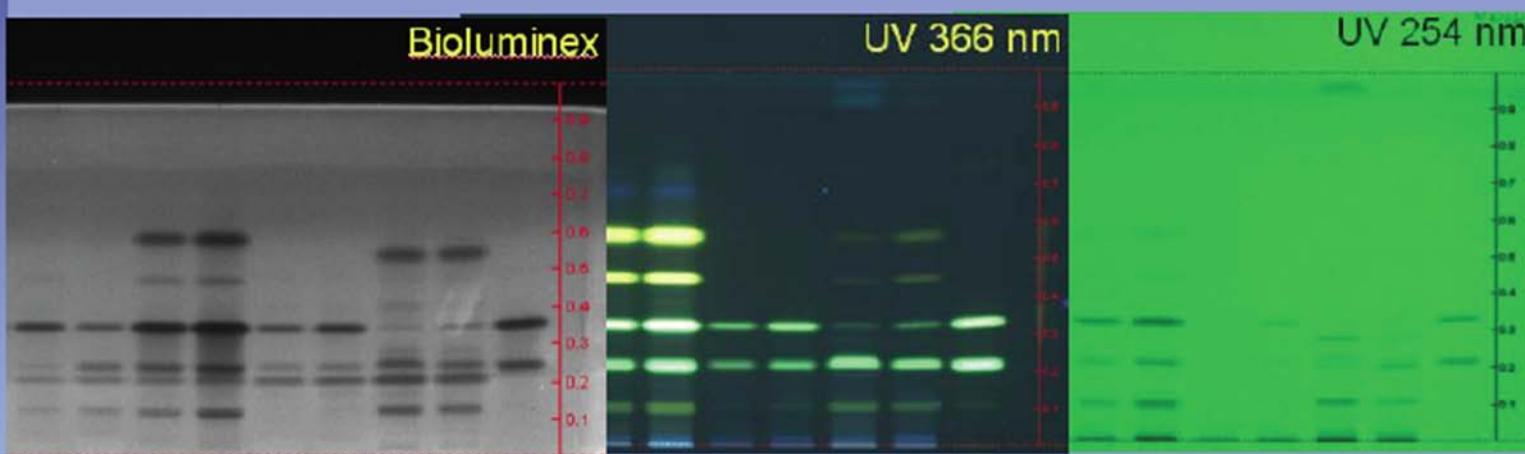

TLC-DB: standards of flumequine applied at 10 µl

Hyphenations:

- UV-VIS
- MS
- IR
- NMR

Natural Product Extracts

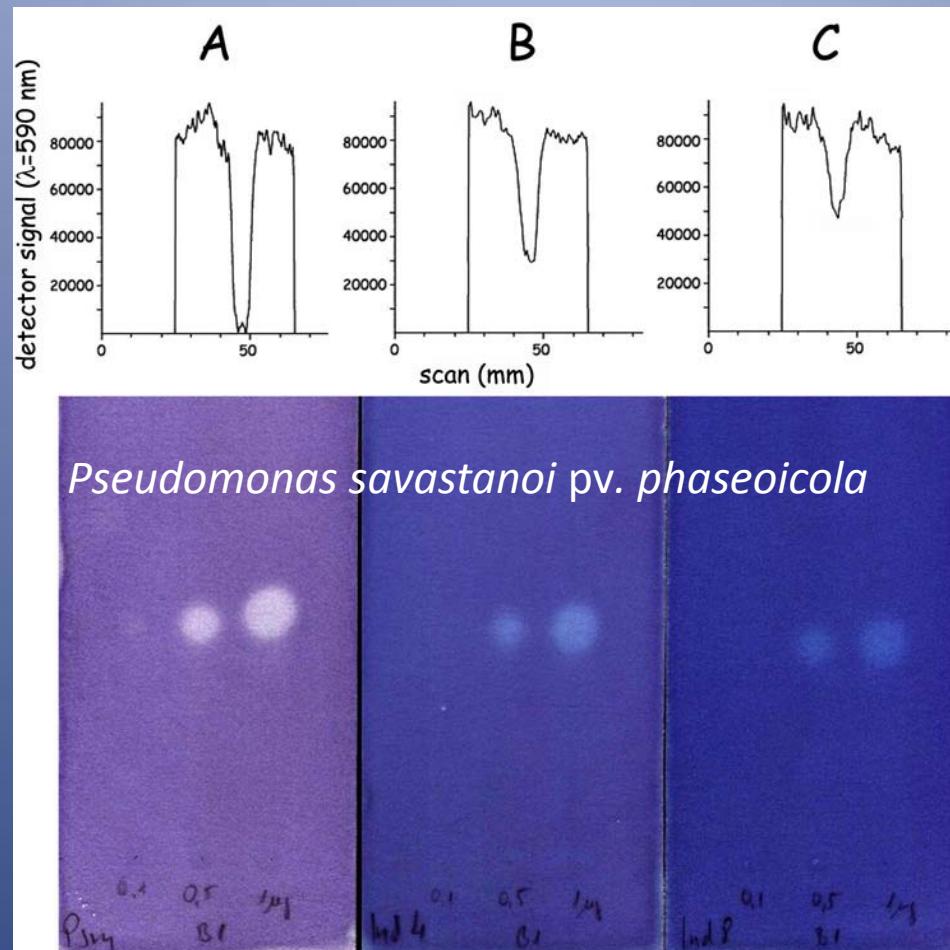

Track Assignment:

- 1-2: Mahonia stem
- 3-4: Golden Thread
- 5-6: Chinese Cork Tree
- 7-8: Tinospora root
- 9: Palmatine, Berberine

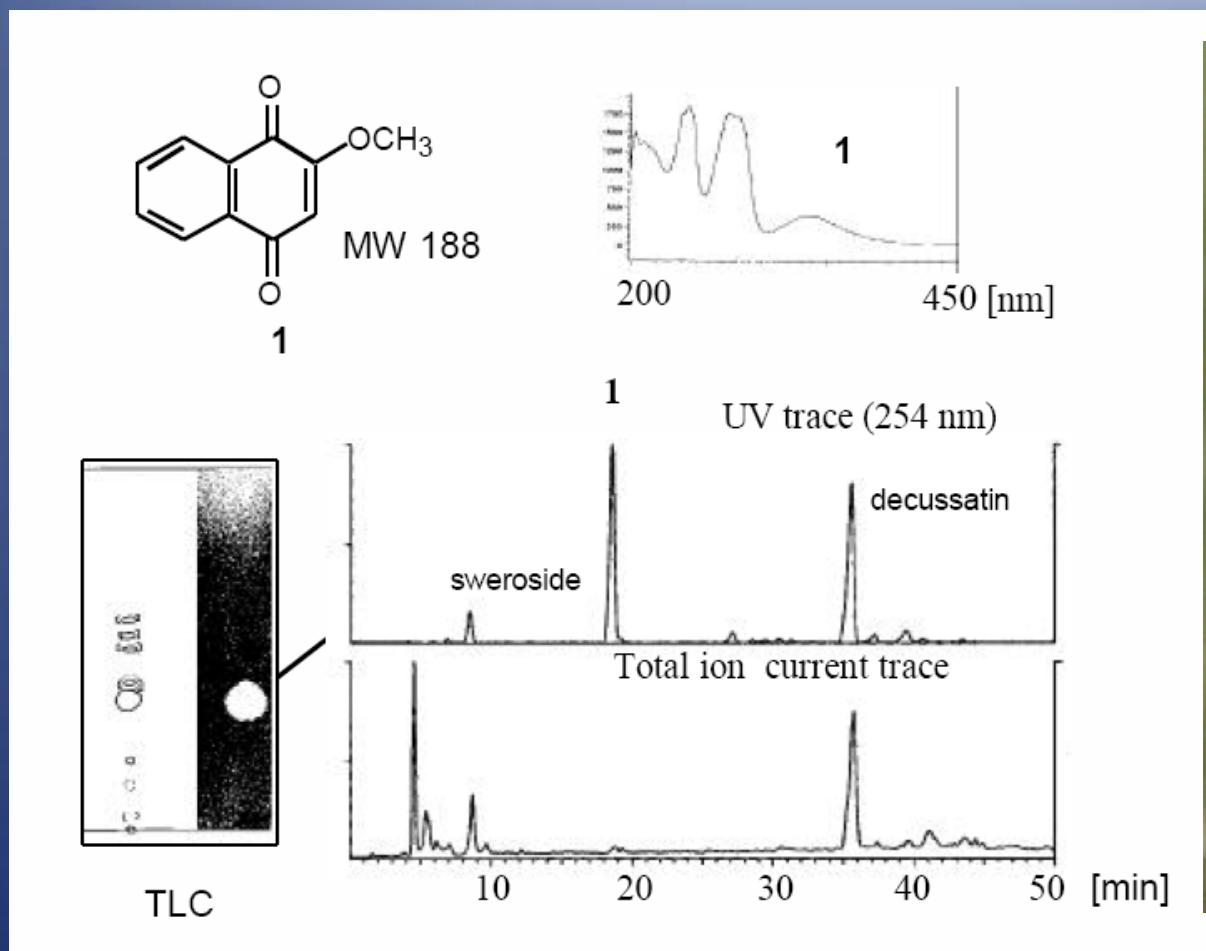

Additional zone (Rf 0.2) detected with Bioluminex assay

TLC-DB BioArena, UV-VIS

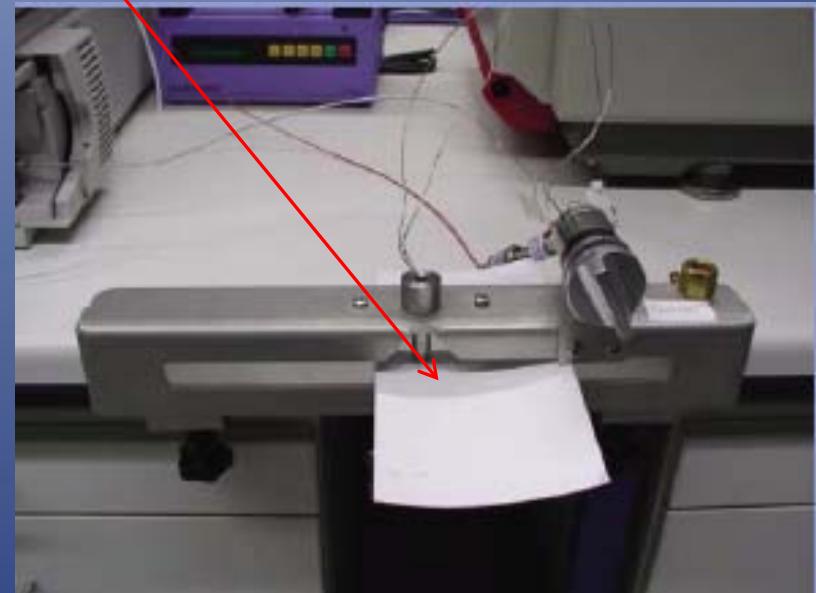

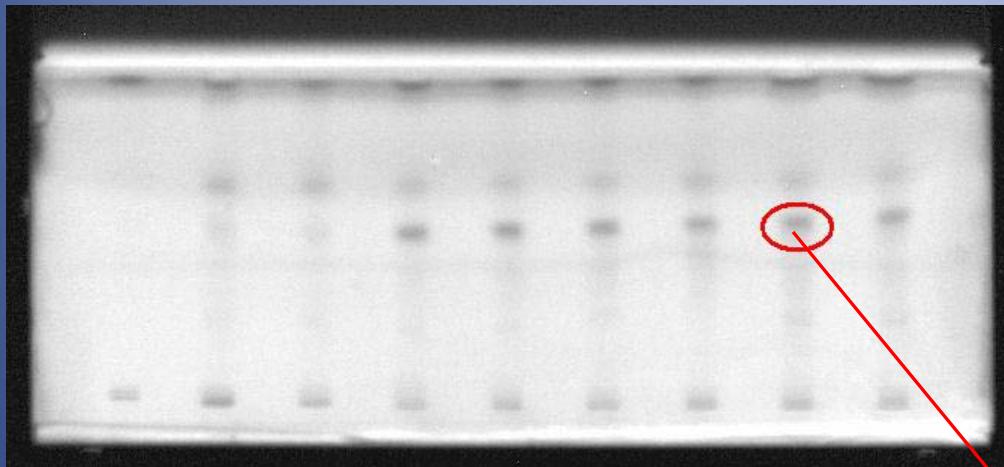

The influence of indigo carmine on antibacterial activity of aflatoxine B₁. A – control plate, B, C – 0.2 , 0.4 mg/ml of indigo in a broth.

TLC-DB, HPLC-UV, HPLC-MS

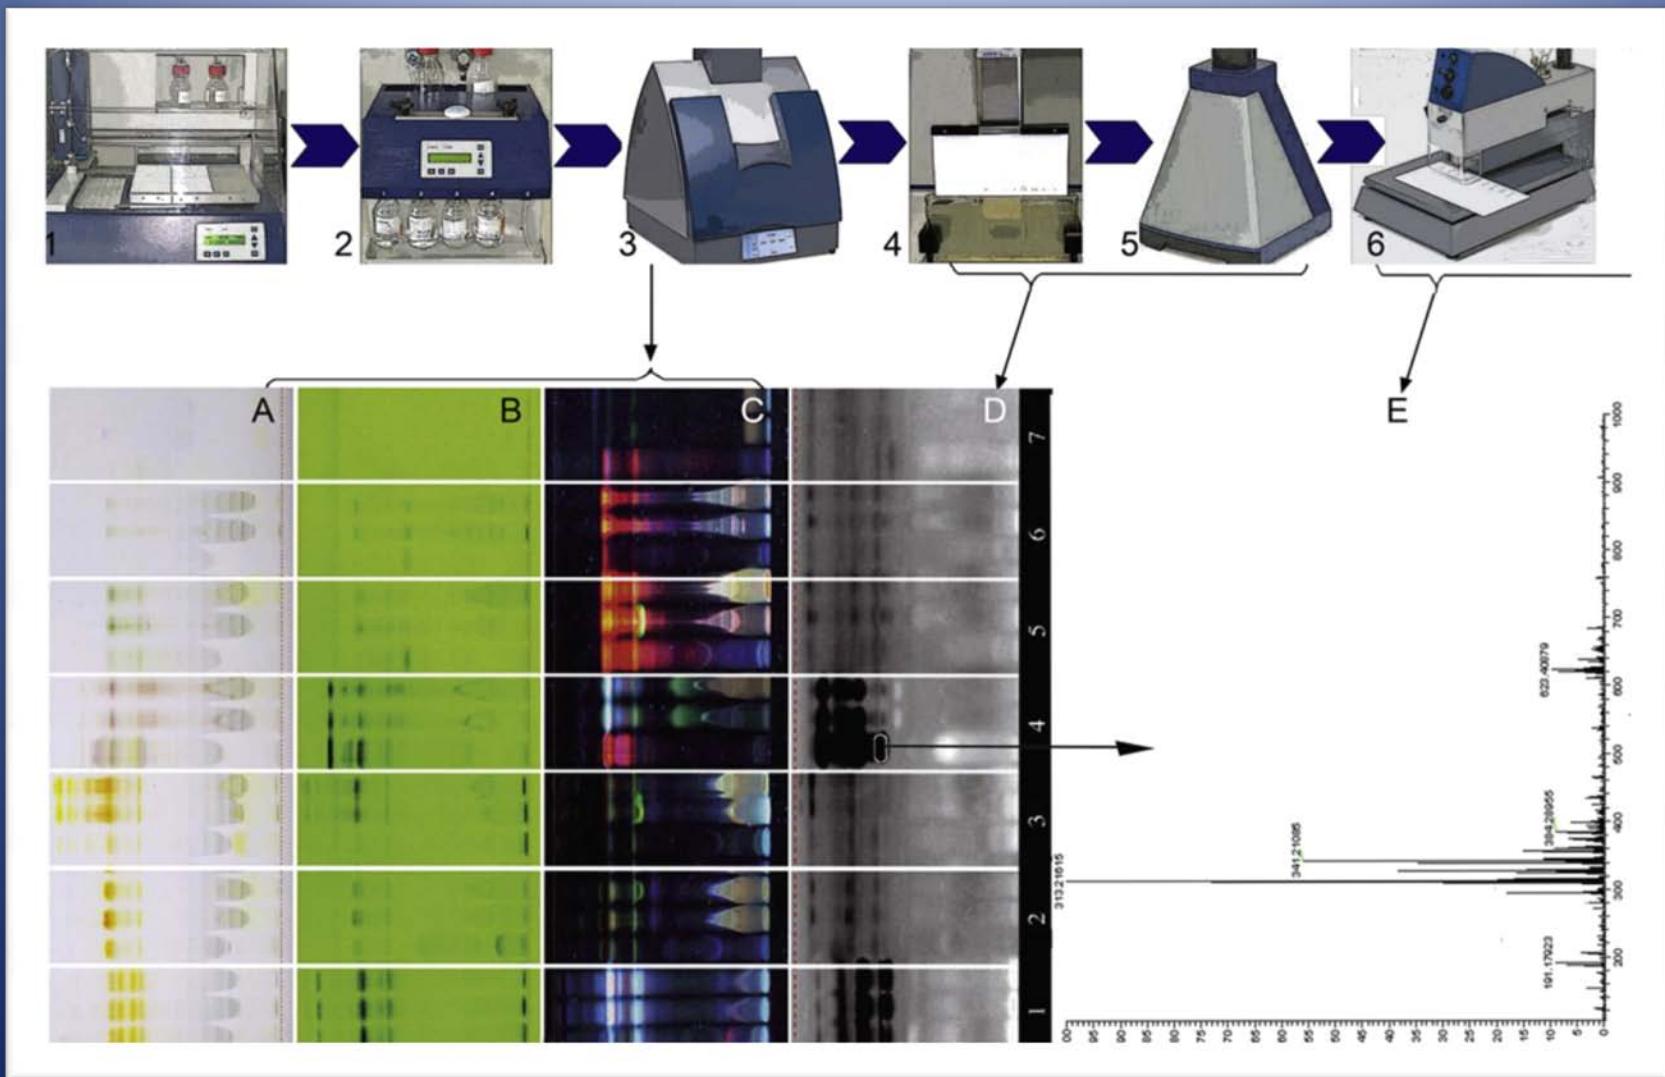

Unknown substance active against *Cladosporium cucumerinum* in *Swertia calycina* plant

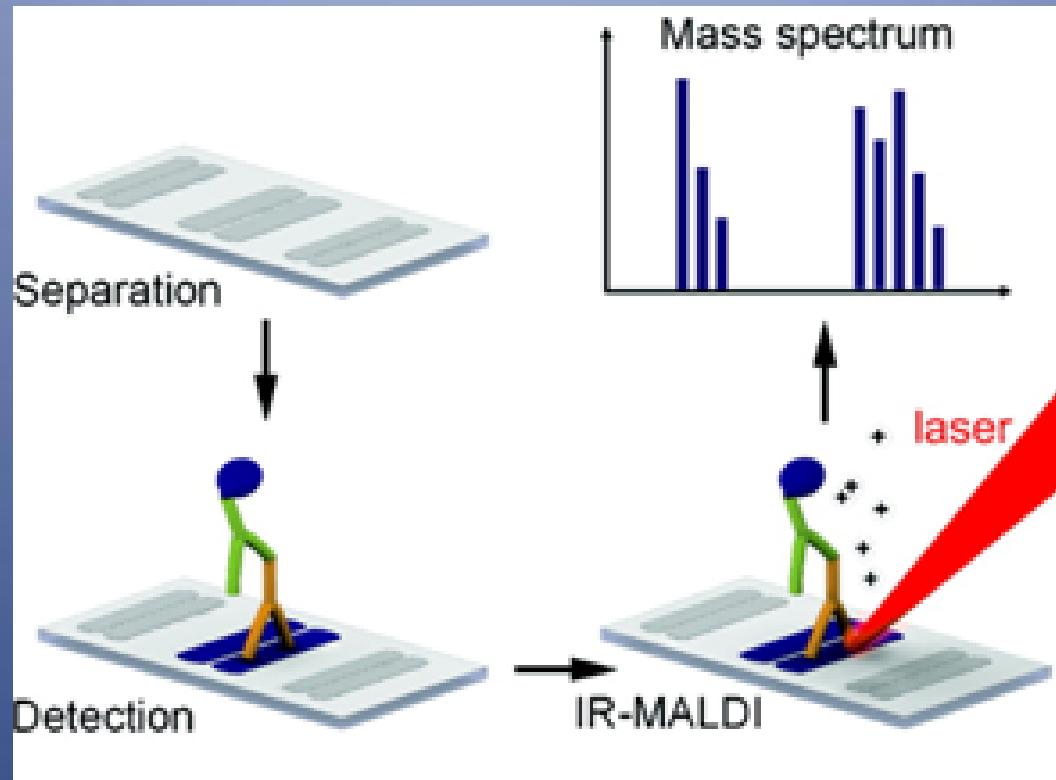

TLC – bioluminescence / MS

HPTLC-UV/Vis/FLD-bioassay-HPLC-HRMS

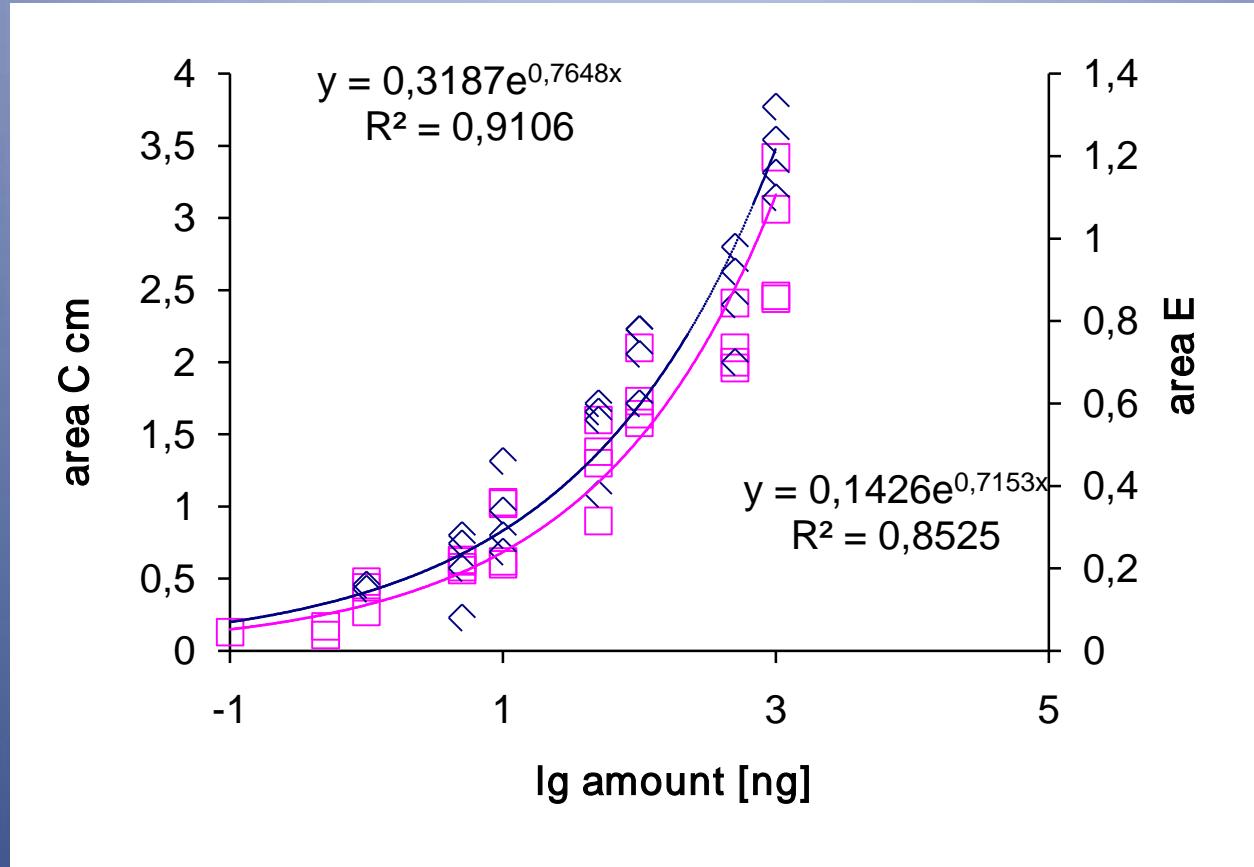

TLC Overlay Binding Assay / IR-MALDI-o-TOF MS

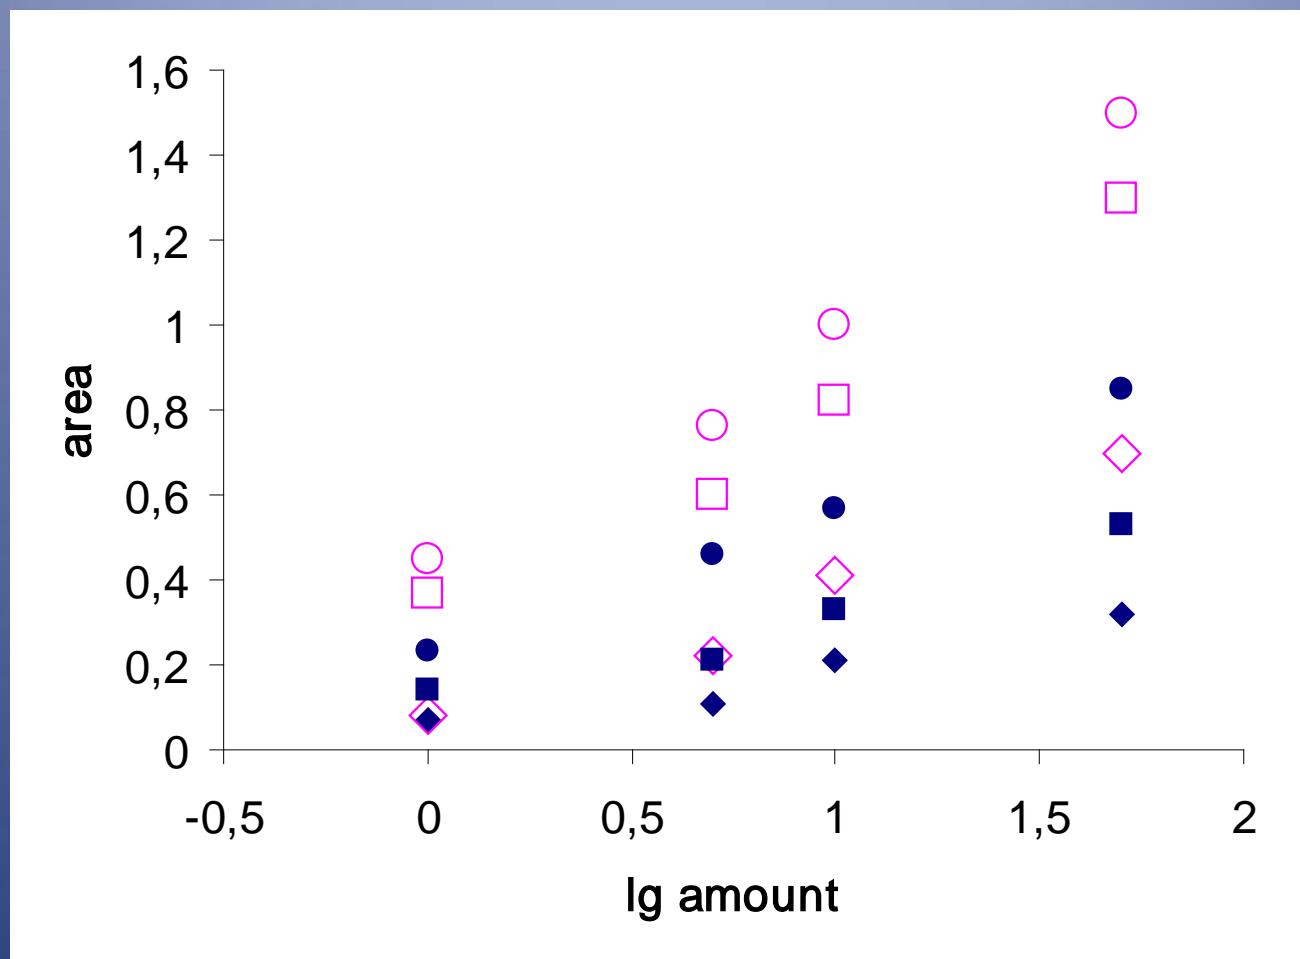

Results

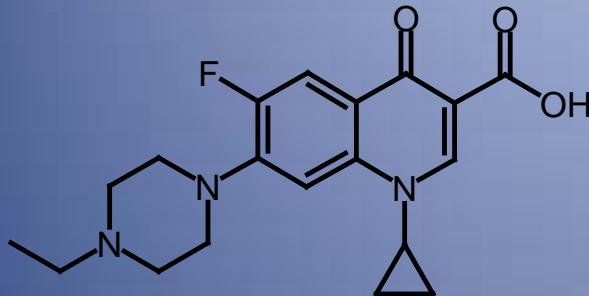

Exponential calibration curves: rhombus – enrofloxacin, square – ciprofloxacin. The data from four bioautograms.

Rhombus – 1, square – 10 , circle – 50 μl of enro- and ciprofloxacin.
